## CERTIFICATIONS:

- AWS Certified Generative AI Developer – Professional
- Certified Associated Python Programming (PCAP)
- AWS Certified AI Practitioner

## SKILLS:

- Python, React, SQL (PostgreSQL)
- AWS (Lambda, API Gateway, S3, IAM), Google Cloud Run
- Machine Learning (scikit-learn), NLP, RAG, LangChain
- REST APIs, FastAPI, Git, Docker
- Data Structures & Algorithms
- Agile/Scrum, Leadership, Teamwork

## CAREER OBJECTIVE:

I am seeking a full-time role where I can build reliable software while contributing to new and emerging product capabilities. I bring a University of Melbourne computing background and practical development experience across backend, frontend, and databases. I also have experience working with AI and machine learning, and I'm keen to help deliver up-and-coming features that create real value for users. I take ownership of tasks, learn new tools quickly, and work well in collaborative teams. I want to join a company that values quality, innovation, and continuous improvement.

## EDUCATION:

**The University of Melbourne (Melbourne International Undergraduate Scholarship)**

**2022–2025**

Bachelor of Science (Computing and Software Systems)

**PISES High School (Saudi Arabia, Riyadh) 2016–2021**

Top of the class with grade equivalent to 99 ATAR (A-Level british curriculum)

## EXPERIENCE:

**Dabozai — Founder and Gen AI Tutor (Melbourne VIC)**

**2025–Present**

I run Dabozai, a platform for providing Gen AI and agentic AI training through structured lessons and follow-along demos. The first course I teach includes theory and hands-on labs using tools such as LangChain, Strands Agents, AWS AgentCore, AnythingLLM, LangFlow, Composio and Claude code. I cover concepts like prompt and context engineering, transformers architecture, MCPs, AI agents and workflows, RAG, running local models and LLM training stages (Pre-training, SFT, RLHF, Back propagation). The second course covers robotics, sensors (temperature, humidity and motion), using computer vision for object recognition. At present, I have conducted 10 sessions for a batch of 5 students per session.

**NBA Emporium – Level 3 Retail Assistant (Melbourne VIC)**

**2024–2025**

In this role, I focused on creating a high-quality customer experience while meeting the store's sales targets and supporting the brand's in-store culture and community goals. The role required strong customer interaction, confident product knowledge, and consistent professionalism while aligning with company values. I supported issue resolution on the floor by handling customer concerns and finding practical solutions that prioritised satisfaction and long-term loyalty. I also completed clothing repairs and assisted with stock organisation and presentation to maintain a polished retail environment. In addition, I helped coordinate in-store events and activations, supporting smooth setup, customer engagement, and team coordination.

**The Bagel Shop – Level 2 Customer Service Team Member (Melbourne VIC)**

**2022–2023**

I was responsible for providing friendly and efficient service to customers while maintaining a clean and well-organised café environment. I worked across multiple locations, including the Swanston Street and South Yarra branches, as well as rotational partner venues such as Otherside Coffee. At the South Yarra location, I was part of the team during the store's opening period and took responsibility for training and onboarding new staff, helping them learn service standards, workflow, and day-to-day routines. My responsibilities also included taking orders, preparing and assembling food and drinks, handling the till and processing transactions, and supporting daily open and close routines. I worked closely with team members during busy periods to keep service smooth, resolve customer issues quickly, and ensure a consistent customer experience across different sites.

During my 6 month internship at Gulf Candle Technologies, I delivered presentations on AI and machine learning for beginners. Using mainly Python, I helped automate data parsing and loading scripts, identifying unused AWS resources and AWS services cost report generation per department. This strengthened my development and cloud skills and gave me my first hands-on industry experience at 18.

## PROJECTS

---

### - Mental Health Services Navigation Using LLMs – Capstone Project

Built an LLM-backed service navigation chatbot to help people with mental health issues based in Victoria to quickly and easily find tailored mental health services near them using natural language. The service feature included data cleanup and ingestion (loading and vector embedding) pipeline, RAG implementation, augmenting vector search results with Google Places API, geofencing to ensure Google Places returns only the results within Victoria, authentication and authorization module with RBAC access management using Supabase Auth module with JWT tokens, user friendly UI. Tech stack comprised of Python, LangChain, Supabase (Postgres + pgvector extension), React, Vercel, FastAPI, and Google Cloud Run. Led delivery as rotating Scrum Master: facilitated client workshops and in-person stakeholder reviews, ran stand-ups multiple times per week, and kept sprint execution on track through clear scope and progress reporting. I also evaluated deployment options and presented spikes and proof-of-concept comparing AWS Lambda to Google Cloud Run and AWS API Gateway to FastAPI with in-person sessions with the rest of the team.

### - Automating Operational Tasks

Working as a part of the IT operations team where I was given the task of automating day to day operational tasks. These included data loading and cleaning for CMDB service team, identifying unused AWS resources, identifying resources with no tags, generating billing reports per department, generating a full inventory of resources across accounts/regions, identifying stale IAM users (no login in 90 days, unused access keys), checking for publicly accessible S3 buckets and generating IAM access reports and permission audits.

### - Sokoban Puzzle AI Solver

Built an AI-powered solver for the Sokoban box-pushing puzzle game. Implemented Dijkstra's graph search algorithm with a custom priority queue and hash table for efficient state-space exploration. Developed deadlock detection optimizations to prune unsolvable states early, significantly improving solver performance on complex puzzles. The solver successfully found solutions across a diverse test suite of increasing difficulty, from simple single-box layouts to large multi-box configurations. Tech stack comprised of Python with custom data structures for the priority queue, hash table, and game state representation.

### - Netflix Content Rating and Genre Prediction Using NLP

Worked in a team to investigate the relationship between Netflix content descriptions and their associated ratings across genres. Built a genre prediction model using Logistic Regression on TF-IDF vectorized descriptions, tuning classification thresholds to optimize precision-recall balance (best F1 at threshold 0.2). Developed a Random Forest regression model to predict IMDB scores, IMDB votes, TMDB scores, and TMDB popularity from descriptions within each genre. Performed data preprocessing including lemmatization, stop word removal, and null handling across a dataset of ~5,850 titles. Enriched missing data fields using the IMDB and TMDB APIs. Visualised word-rating correlations per genre using matplotlib. Tech stack comprised of Python, scikit-learn, NLTK, spaCy, matplotlib, and pandas.
